

Abstract of the Disclosure:

A home delivery system to which this invention is applicable is comprising a sender terminal unit, a receiver terminal unit, and a distribution center unit connected to the sender terminal unit and the receiver terminal unit through a network. The distribution center unit receives from the sender terminal unit a request specification information for requesting to deliver a package, picks up from the request specification information a sender identity information of a sender end, and generates by referring to the sender identity information a collecting direction information for directing a distribution center to pick up the package.
